Notes

From obs: "This morning I was ascending Flanders Peak via the southeast trees. At approximately 1:30PM, on our second lap of the south-southeast bowl of Flanders Peak, I was skinning behind my friend who was putting in a new ascent [track](#) when we both heard a large "whump" and a 15 foot crack shot out from under his skis. I also witnessed him drop several inches from the large [collapse](#) in the snow. We were on a very low angle slope (less than 25 degrees) at approximately 9700 feet, in wide open trees right at the edge of tree-line and the alpine. We noticed no other signs of instability in the bowl we skied, or on the wind-loaded ridge."
